Audit Workflow

This is the standard process for every brand audit. When the prompt is "audit [brand]" or "scrape [brand]," run these steps in order.

Step 0: Set up the brand folder

Create `/[brand_name]/` inside this project folder. Inside it, create:

- `[brand]_audit.xlsx` (start empty with column headers — see OUTPUT_TEMPLATES.md)
- `[brand]_content_mining.md` (start with the template scaffold)
- `[brand]_audit_log.md` (start with the date and brand URL)

Step 1: Enumerate all products

Open the brand's website. Find the full product catalog. For most brands this means scraping the "Shop All" or "Products" page, plus walking each category page (cleansers, conditioners, stylers, treatments, etc.) to catch anything not on the main shop page.

Build a master list with:

- Product name
- Product URL
- Category (as the brand categorizes it)
- Product type (mapped to one of the 12 types from the Puberty Scanner: leave-on skincare, rinse-off skincare, body wash/shampoo/conditioner, lip product, deodorant, sunscreen, makeup, hair styling, oral care, laundry/cleaning, period care, other)

Log the master list in the audit log before scraping individual pages. This way if the run gets interrupted, the resume point is obvious.

Step 2: Scrape ingredients per product

For each product on the master list:

1. Open the product page.
2. Find the ingredients section. It might be labeled "Ingredients," "Full Ingredients," "Formula," or buried in an accordion/dropdown.
3. Copy the full INCI list verbatim. Do not paraphrase, don't fix typos, don't expand abbreviations.

4. Paste into the spreadsheet's `ingredients_verbatim` column.
5. If you can't find the ingredient list, log status as `ingredients not found on page` and move on. Do not guess.
6. Save the spreadsheet after every product. Not every 10 — every one.

Step 3: Grade each product

For each product with verbatim ingredients captured:

1. Run the scoring procedure from `GRADING_RUBRIC.md`:
    - Look up each ingredient in `Ingredient_Safety_Reference.pdf`
    - Apply pattern-matching for ingredients not in the PDF
    - Separate naturally occurring fragrance components
    - Apply conditional rules
    - Apply automatic escalations (heavy metals, PFAS, formaldehyde-releasers)
    - Tally flags and assign tier
2. Fill the spreadsheet row:
    - tier
    - flag_count
    - flagged_ingredients (list with risk categories)
    - naturally_occurring_allergens
    - unknown_ingredients
    - automatic_escalations_triggered (yes/no, which one)
    - one_line_summary
3. Save the spreadsheet.

Step 4: Generate the content mining report

After all products are graded, write `[brand]_content_mining.md` using the template in `OUTPUT_TEMPLATES.md`. This is where the data turns into raw material for social posts.

The report needs three sections:

Section A: Brand-level callout

- Total products audited
- Tier distribution (how many in each tier)
- The single most-flagged product

- The single cleanest product (if any)
- Headline finding in one sentence (e.g., "Of 31 products audited, 4 are Puberty Safe.")

Section B: Pattern callouts

- Most common flagged ingredient across the brand
- Most common risk category across the brand
- Any "hiding in plain sight" finds (e.g., a product marketed as "clean" or "natural" that pulls a high tier)
- Specific naming patterns that show up repeatedly (e.g., "every conditioner has at least one `-nium` ingredient")

Section C: Comparison angles

- Best vs worst within a single product category (e.g., best vs worst conditioner)
- Products with similar marketing language but very different grades
- Cleanest product in each category

For each finding, write a 1-2 sentence note that could become the spine of a social post. Don't write the captions — that's Nina-Marie's job. Just give her the data points.

Step 5: Close out the audit log

Final entries in `[brand]_audit_log.md`:

- Total time elapsed
- Products successfully scraped vs failed
- Anything weird (broken pages, missing ingredient lists, brand reformulation notes)
- Manual review items (the unknown ingredients flagged across all products, deduplicated)

Step 6: Tell Nina-Marie it's done

Brief summary message:

- Brand name
- Number of products audited
- Tier distribution in one line (e.g., "0 Puberty Safe, 3 Use Caution, 8 Avoid Mild, 14 Avoid Moderate, 6 Avoid High Priority")
- Single most interesting finding
- Filenames where she can find the outputs

No emojis. No "Hope this helps!" Just the facts.

Resume protocol

If the audit gets interrupted partway through:

- Open `[brand]_audit_log.md` to see what's been done
- Open the spreadsheet to see the last completed row
- Resume at the next product on the master list
- Don't redo completed rows unless the rubric has changed
